

"Unable to open a session" - unable login to centos server from ezeelogin jump server

141 admin October 4, 2024 [Common Errors & Troubleshooting](#) 25624

Unable to open a session- ssh session fails with pam_systemd(sshd:session): Failed to create session

Overview: This article provides troubleshooting steps to resolve the "Unable to open a session" error that occurs when logging into the remote server via Ezeelogin gateway. It includes steps for verifying SSH connectivity, adjusting timeouts, restarting systemd-logind.service, and managing /var/log/btmp size to ensure reliable authentication and session management.

Below shows error from `/var/log/secure`

```
Sep 4 17:56:05 server2 crond[938922]: pam_systemd(crond:session):  
Failed to create session: Activation of org.freedesktop.login1 timed  
out

Sep 4 17:56:05 server12 sshd[938752]: pam_unix(sshd:session): session
closed for
```

Step 1: Ensure that you can manually SSH from the gateway server to the remote server (bypassing the Ezeelogin ezsh interface).

```
root@gateway:~# ssh username@remoteserver_ip or hostname
```

Step 2: Change the SSH Timeout value to 300 seconds from 10 seconds to rule out network slowness and a connectivity issue. Navigate to **Settings -> General -> Miscellaneous -> SSH Timeout**

Step 3: Restart systemd-logind.service on the **remote server**:

```
root@remoteserver:~# systemctl restart systemd-logind.service
```

Step 4: Check for the messages in the [ezsh.log](#) file located at `/home/{username}/ezsh.log`

```
Authentication by SSH key DB failed :
```

```
Channel failed (shell): Timed out waiting on socket
```

Step 5: Check for the messages under `/var/log/secure` and `/var/log/messages`

```
sshd[236622]: Accepted publickey for root from 46.232.178.114 port  
40506 ssh2: RSA SHA256:cpVnOWHn+WeiGl4JuYAlMtx39Vx5Dz82CuN7I12yITI
```

```
sshd[236622]: pam_unix(sshd:session): session opened for user root  
by (uid=0)
```

```
systemd-logind: New session c100 of user root.
```

```
systemd: Started Session c100 of user root.
```

```
systemd-logind: Removed session c100.
```

Step 6: Check the size of the `/var/log/btmp`. You can check that by running the following command on the remote server

```
root@remoteserver:~# ls -lah /var/log/btmp
```

Step 7: If the size of `/var/log/btmp` is high then truncate the logs in `/var/log/btmp`. You can truncate the logs by running the following command on the remote server.

```
root@remoteserver:~# > /var/log/btmp
```
