## How to add a remote server into ssh gateway using SSH keys?

---

This article explains how to add a remote server to an SSH gateway using SSH keys, even when the root password is unknown.

When adding the target server to the SSH gateway, **select 'keep server password'** for password management, and manually add the SSH gateway's public key, which can be found in **Servers -> Global key, to the /root/.ssh/authorized\_keys** file on the target server.
