How can I forward env variables over ssh in ezeelogin?

Overview: This article helps Ezeelogin gateway users to set passthrough environment variables that should be allowed to be passed to the remote servers when logging in via Ezeelogin SSH jump host.

Step 1: Login to Ezeelogin GUI and add the environment variables under **Settings -> General -> Security -> Passthrough Environment Variables**

The screenshot displays the Ezeelogin GUI with the 'Security' tab selected in the 'General Settings' section. The 'Passthrough Environment Variables' field is highlighted with a green arrow, showing a list of variables: LANG, LC_CTYPE, LC_NUMERIC, LC_TIME, LC_COLLATE, LC_MONETARY, LC_MESSAGES, LC_ALL, java_home. The 'Security' tab is also highlighted with a green box in the top navigation bar.

Step 2: Allow environment variables to the `/etc/ssh/sshd_config` file of both the **Ezeelogin** installed **server** and the **remote server**.

```
root@gateway:~# vi /etc/ssh/sshd_config  
  
AcceptEnv java_home
```

Step 3: Restart ssh service

```
root@gateway:~# service ssh restart
```

Step 4: Add the environment variables to the **/etc/ssh/sshd_config** file of the **desktop machine** or the **machine from which you need to forward the environment variables** as follows:

```
root@desktop:~# vi /etc/ssh/ssh_config  
  
SendEnv java_home
```
