How to set the expiry for Ezeelogin SSH gateway users?

This feature lets you manage the duration for which an ssh gateway user will have access to the gateway after which it expires. The duration of the ssh access to the gateway can be set to expire in minutes, hours, days, or on a date as shown below. This is useful while granting temporary access to a user.

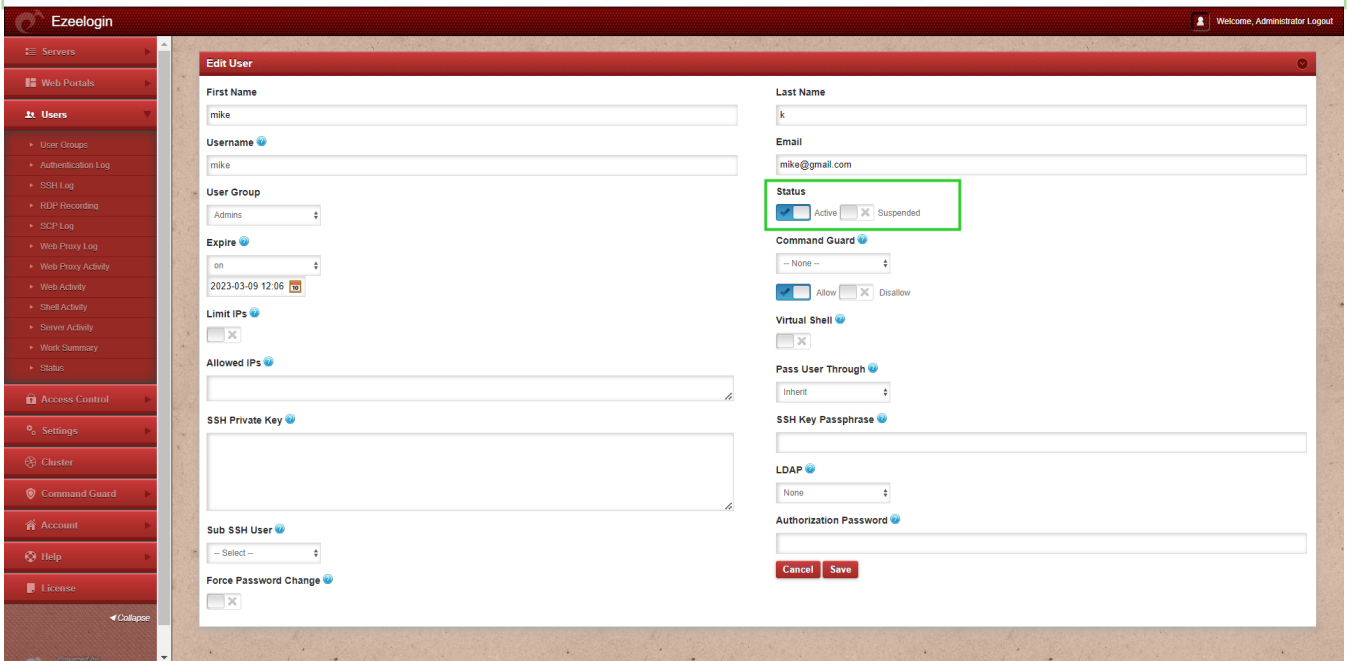

Refer below screenshot to set ssh user expiry:

After the duration of expiry, the user gets suspended. You can disable the user's suspension by setting the status of the user as Active as shown below,

Note: Only the admin-privileged user would be able to login into the web interface and suspend the users (users>edit>Enter authorization password> save). Note that this is possible for admin privileged users and not for any other user.
