

## Primary node showing the public ip instead of lan ip when cluster is configured

243 admin November 21, 2018 [Common Errors & Troubleshooting](#) 3117

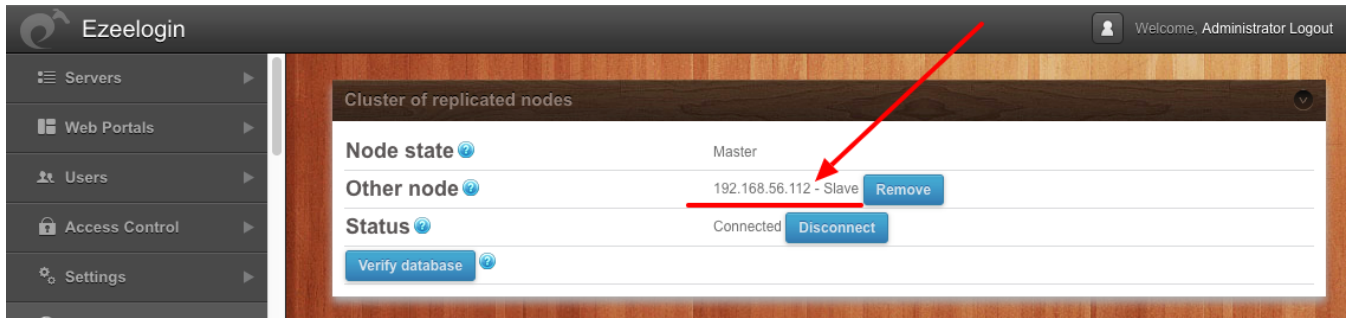

The cluster tab of master node shows the licensed secondary ip and not the lan ip of the slave node. This happens when the slave node is behind a NAT.

In order to correct the other node ip, run the following command

```
/usr/local/ezlogin/ez_queryrunner.php "update prefix_settings set value='192.168.56.112' where name='remote_ip'"
```

Now the cluster tab would show the lan ip of the other node instead of the public ip
