

Backup/restore crashes abruptly without any error

328 Riya Francis July 24, 2024 [Common Errors & Troubleshooting](#) 2588

Ezeelogin restore/backup crashes abruptly without any error.

Overview: This article describes finding and interpreting backup and restore logs under `/var/log/`, and recommends increasing the PHP memory limit in `/etc/php.ini` if logs indicate memory errors.

1. Find the restore backup logs under the `/var/log/` directory.

- If the [restore or backup](#) logs contain similar content as given below increase the PHP limit in the `php.ini` file of the gateway server.

```
root@jumpserver:~# tail /var/log/ezlogin_restore.log
```

```
Environment: Linux (x86_64) - PHP 5.3.3 (memory limit: 128M MB)
```

```
ezeelogin v6.1.0 ...
```

```
Environment: Linux (x86_64) - PHP 5.3.3 (memory limit: 128M MB)
```

```
ezeelogin v6.1.0 ...
```

```
root@jumpserver:~# tail /var/log/ezlogin_backup.log
```

```
Environment: Linux (x86_64) - PHP 5.3.3 (memory limit: 128M MB)
```

```
ezeelogin v6.1.0 ...
```

```
Environment: Linux (x86_64) - PHP 5.3.3 (memory limit: 128M MB)
```

```
ezeelogin v6.1.0 ...
```

2. Increase the PHP limit.

- To fix the above error, you need to [Increase the memory limit](#) in the /etc/php.ini file (Increase the memory limit up to 1Gb or more.)

```
root@jumpserver:~# nano /etc/php.ini
memory_limit=1024M
```
