Do LDAP users require a new password and security code?

Overview: This article clarifies whether LDAP users need a new password and security code after being imported into Ezeelogin.

Passwords don't need to be created for LDAP users, but it is ideal to create a security code. You can also use the [LDAP password as the security code](#), though it is recommended to keep them separate for better security.

Step 1: The security code can be created by navigating to **Account -> Password -> Security Code**. Provide the authorization password (**Authorization Password** is the password of the currently logged-in user) and click on **Save**.

Step 2: To use the LDAP password itself as the security code, navigate to **Settings -> General ->**

Authentication -> Security Code LDAP. This setting can only be enabled by the admin privileged user.
