

# Could not authenticate with any LDAP server

510 admin March 27, 2025 [Common Errors & Troubleshooting](#) 2267

## Could not authenticate with any LDAP server

**Overview:** This article provides an overview of troubleshooting steps to resolve the "Could not authenticate with any LDAP server" error, including verifying server reachability, checking SSL/TLS configurations, reviewing application logs, validating bind credentials, and testing authentication settings.

How to fix Error: **Could not authenticate with any LDAP server**

To resolve the above error, consider the following steps:

**Step 1.** Verify whether the [LDAP server](#) is reachable from the gateway server.

This can be verified by running the following command:

```
root@gateway:~ telnet ldap_server_ip 389
```

For Example:

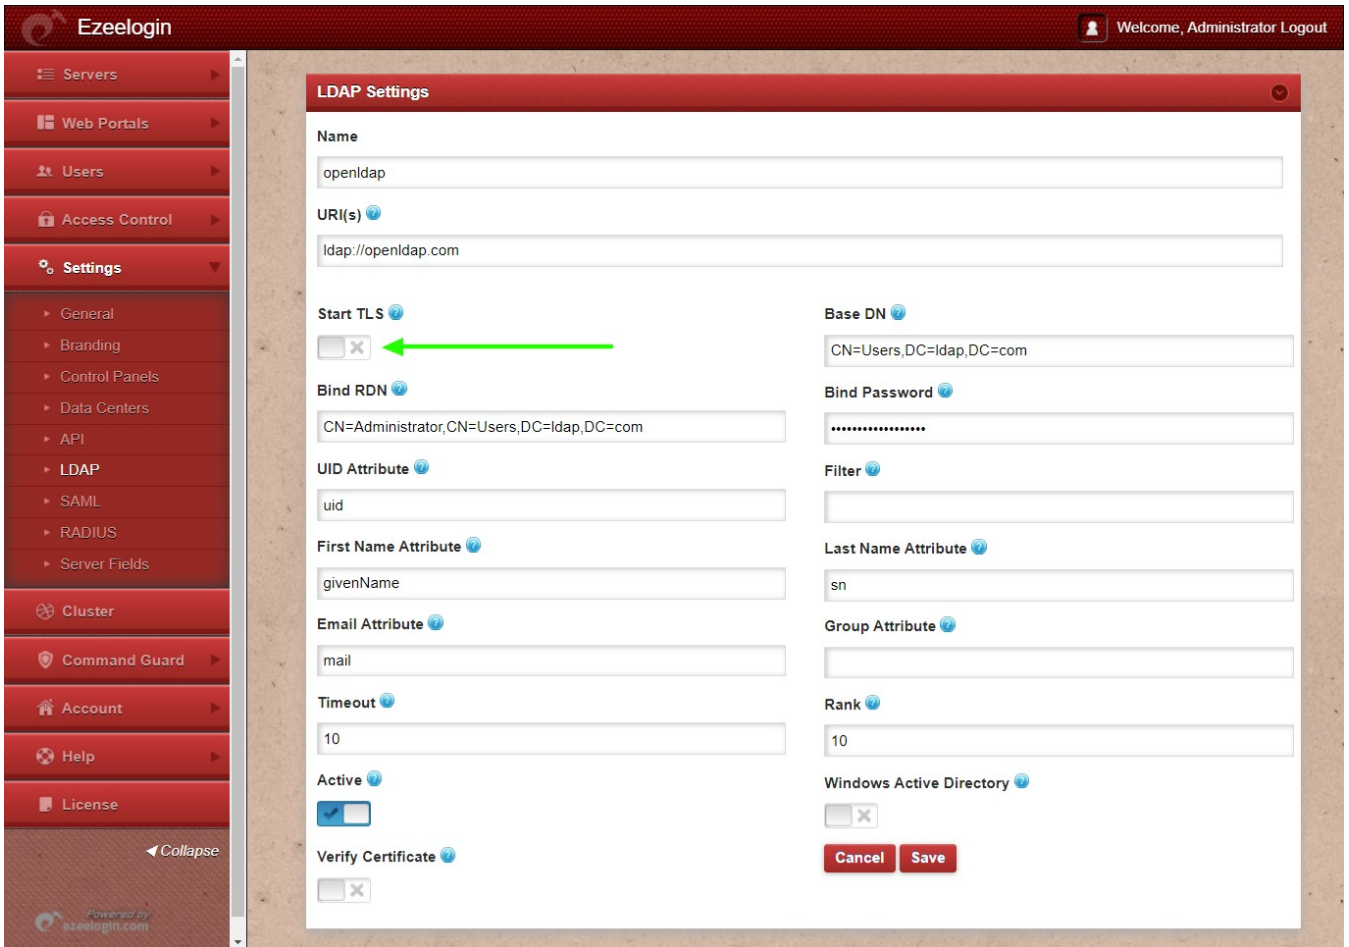

```
root@gateway:~ telnet 192.168.56.148 389
```

**Step 2.** If LDAP is configured with [SSL](#) or TLS in the Ezeelogin GUI, test it **without SSL or TLS**.

Multiple URIs or a list of URIs can be specified in the format:

- `ldaps://host.com:636/ ldaps://host.com:636/`

*(Only the protocol, hostname, and port fields are allowed.)*

**Step 3.** Check what is under the [error log](#).

The log files are stored in the **system\_folder** specified at the time of installation. The path can be found by examining the system\_folder in /usr/local/etc/ezlogin/ez.conf. The path will be /{system folder}/application/logs/.

**For example:-**

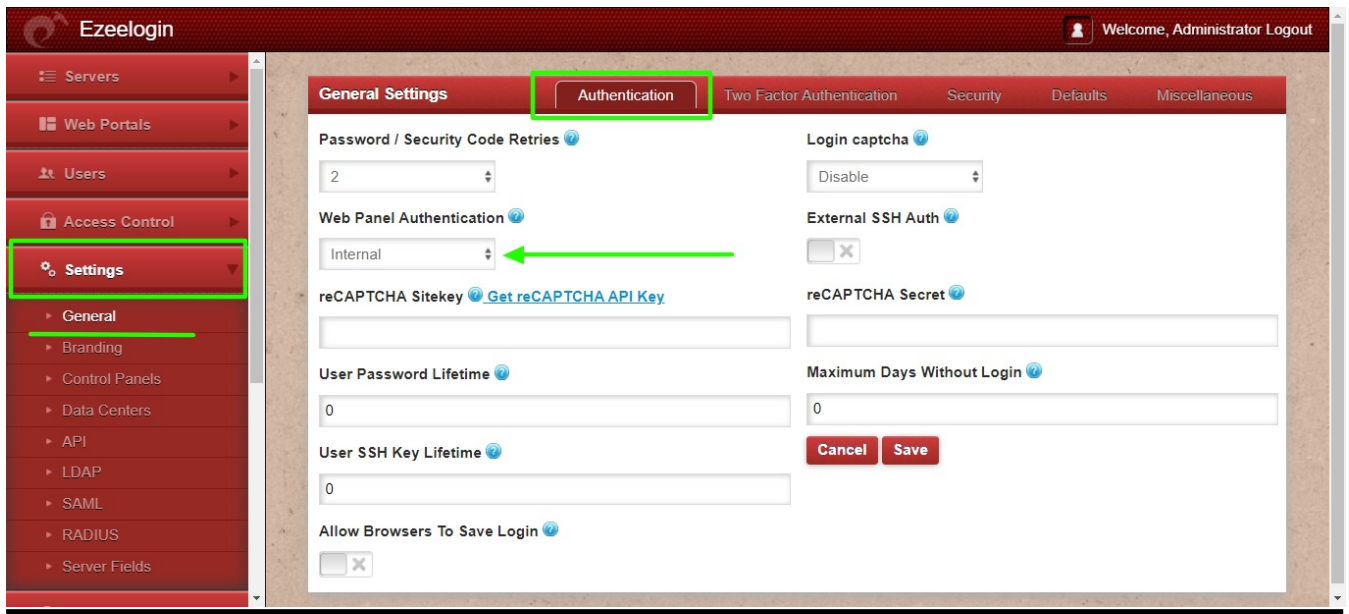

```
root@gateway:~# tail /var/www/ezlogin/application/logs/log-2022-06-23.php
```

**Step 4.** Check whether the bind password and bind username is correct. If the bind password or username is wrong the application logs will show **Severity: Warning --> ldap\_bind(): Unable to bind to server: Invalid credentials**

**Step 5.** Check if the problem affects all users or only a single one.

**Step 6.** Are you still having problems after logging in as super admin?

**Step 7.** Switch the LDAP authentication to Internal and try it out.
