

# List Apache Modules in Linux

528 Nesvin KN August 29, 2022 [General](#) 2218

How to list which apache modules are enabled in CentOS/Ubuntu server?

Run below command to find the information for **apachectl**.

CentOS/RHEL

Run below command to view the list of **enabled modules** in **CentOS/RHEL**.

Refer below example to enable the **echo module** in **CentOS/RHEL**

1. Replace the required module name to find if it's enabled on the server. Here I'm using the **echo module** as an example and it is not enabled on my server.

2. Edit the **module configuration file** and append the below line to **enable the echo module**.

3. Rerun the below command to confirm the module has been enabled.

## Ubuntu/Debian

Run below command to view the list of **enabled modules** in **Ubuntu/Debian**.

Refer below example to **enable SSL modules** in **Ubuntu/Debian**.
