

Invalid subsystem request while using WarpTerminal

585 admin February 27, 2023 [Common Errors & Troubleshooting](#) 1719

Invalid subsystem request while using Warp SSH client.

The error can be found in the ezsh log in the users home directory.

To resolve the issue, use the absolute path to the `ssh` command as shown below when using the Warp SSH Client

```
ezadmin@gateway.eznoc.com
```

The error occurs because the warp ssh client tries to execute remote command which the [ezsh shell](#) does not permit as a security measure to prevent remote command execution on the Ezeelogin ssh jump server.
