How can you include a single server in two distinct groups

Overview: This article describes how to give two user groups access to a single server by using a shared server group managed through a supergroup.

You can include the same server for 2 gateway users using the following steps. Here you'll be creating 2 distinct user groups for 2 gateway users or continuing with an existing one for instance. Next, generate a shared server group responsible for overseeing both gateway users and grant both users permission to access this shared server.

Step 1: Create **two user groups** (Under Users tab > User Groups > Click on ➕ icon) **for two distinct teams** for instance Developer and Tester.
Refer: [How to create user group](#)

**Step 2:** Include those two users in the corresponding distinct user group.

Step 3: Create a Common Super Group for two distinct teams.
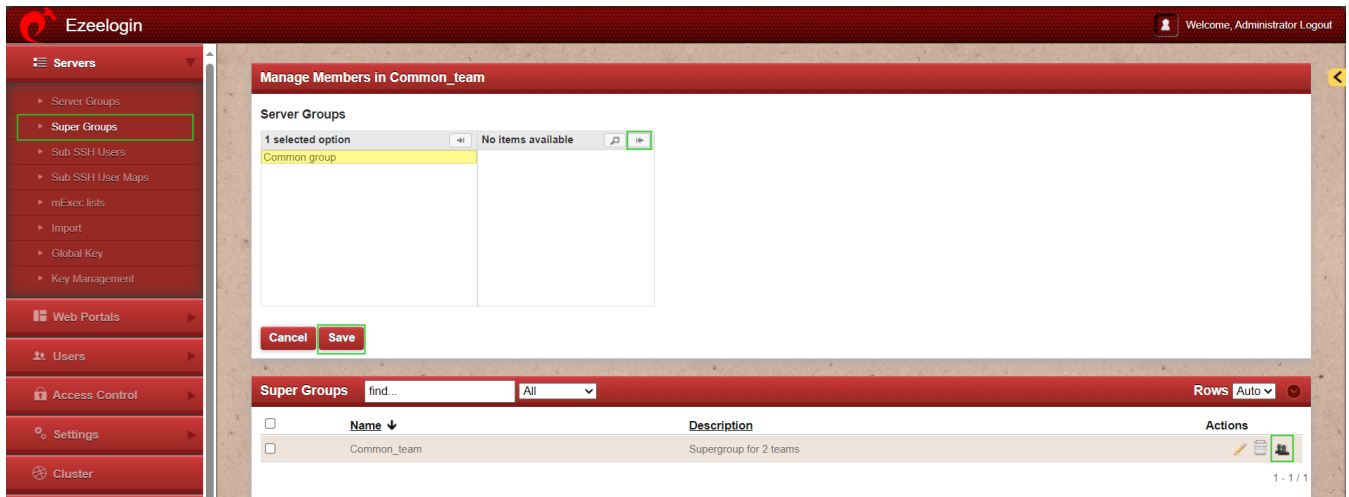

Refer to manual: [What is Super Group](#)

**Step 4: Create a common server group** or two distinct teams.

Refer. [How to add a server group](#)

Step 5: Manage the supergroup members from the server group.

Step 6: Provide permission access to two user group members to server groups.

Now, the corresponding users Evan & Mila can log in to the common server.
